Business Requirements Document: Bank Fraud Detection Dashboard

Prepared by: Akshay R | Date: 04/11/2026 | Version 1.0

1. Purpose

This dashboard helps a bank's fraud team quickly see which transactions are flagged as risky, where they happen, and what type they are.

2. Business problem

The bank has tens of thousands of transactions. Checking them by hand is slow, and risky ones can be missed.

3. Stakeholders

- Fraud manager: wants a quick summary
- Fraud analyst: reviews the flagged transactions
- Note: requirements were assumed by the analyst.

4. Requirements

- R1: Show total flagged amount, count of flagged transactions and fraud rate.
- R2: Filter by risk category (Critical, High) and by city.
- R3: Show monthly trend of flagged transactions.
- R4: Show flagged amount by city.

- R5: Show a table of flagged customers with amount, transaction type and risk level.
- R6: Show split by transaction type (Deposit, Withdrawal, Transfer).
- R7: Show fraud alerts by alert type.

5. KPIs

Total flagged amount, count of flagged transactions, fraud rate %.

6. Data source

Synthetic data generated with Python and stored in MySQL.

7. Out of scope

Real-time alerts, automatic blocking of transactions, real bank data.

8. Success criteria

The dashboard numbers match the SQL results, and the filters work correctly.
